# Setup EXCEL-IMAGE-IMPORTER

---

After buying, or after downloading the testversion, you have several Excel-files.

Normally one of them is for the right usage:

1. ExcellImageImporter\_V\_xxx\_32Bit\_xxx.XLAM
2. ExcellImageImporter\_V\_xxx\_64Bit\_xxx.XLAM
3. ExcellImageImporter\_MAC\_xxx.XLAM

No 1 is for usage, when you have a 32 Bit Excel Version

No 2 is for usage, when you have a 64 Bit Excel Version

**PLEASE NOTE: it depends on the Bit Version of your OFFICE System – not of your Windows system**

No 3 is for usage on your MAC with Excel 2011

## **There are three ways to run Excel-Image-Importer:**

1. Open Excel and one Workbook and then doubleclick the AddIn file. Then you have the ribbon bar of Excel-Image-Importer.  
This could be the right way, if you use the AddIn sporadically.
2. Open Excel, goto to the Options and choose AddIns and then Excel-AddIns to add the AddIn file to your AddIns. Then you will see the Excel-Image-Importer ribbon bar every time you use Excel
3. Press the windows button on your keyboard and type „%appdata%“ . Then the explorer will open. Goto to MICROSOFT then to EXCEL an then to XLSTART. Copy the AddIn file in this folder. Please note: Excel has to be closed during this operation. Then you will see the Excel-Image-Importer ribbon bar every time you use Excel.

## **Switch to english interface language:**

Goto „Einstellungen“ in the ribbon bar, then an userform will open. Then goto to „Sprache“ and choose „English“. Then click on „Speichern“. Then the ribbon bar is already in english. The next time you open „settings“ it will be shown in english.
